CapabilityMap v0.2.0 Live Audit Report

Scenario: linux_ssd (Linux on external SSD, booted from Windows-hosted tooling)

Source bundle: CapabilityMap_v02_Live_Audit_Bundle.json, executed 2026-11-08T19:15:31Z. Licenses checked against public repository pages on 2026-11-08.

1. Summary

The audit ran five phases against the CapabilityMap server: search decomposition, MCP wire protocol, prompt-injection quarantine, human override locking, and telemetry replay protection. All phases behaved as designed. For the linux_ssd goal, Ventoy with vtoyboot is the most relevant candidate. Rufus is useful for Windows-side media preparation but does not produce a native installed system. WinDiskWriter should be excluded from this scenario because the bundle lists Windows support that its README contradicts.

2. Search Decomposition

Query: *linux_ssd*. The server split the request into three concepts: Windows-hosted Linux installation, external SSD passthrough, and UEFI fallback boot. Four candidates were returned. None were quarantined.

Project	Verification	License (audit)	Weighted score	Key limitation
ventoy/Ventoy	verified	GPL-3.0-or-later	0.901	Needs the Linux .vhd/.raw image provisioned via a VM first
pbatard/rufus	evidence_checked	GPL-3.0	0.910	Creates a Live USB, not a full root-on-SSD install
TechUnRestricted/WinDiskWriter	evidence_checked	GPL-3.0	0.860	macOS-only app; bundle's Windows/Linux OS support is incorrect
Kruszoneq/macUSB	unreviewed	MIT	0.850	Unreviewed community submission; Mac-focused

Unresolved gap (reported by the server): cross-machine suspend/hibernate behavior and proprietary GPU driver switching across arbitrary third-party motherboards are unverified.

3. Security and Integrity Checks

Check	Result	Detail
Direct prompt injection	Quarantined	Flagged: instruction override and score manipulation
Base64-encoded injection	Quarantined	Flagged: same categories after encoding
Human override lock	Protected	Automated update blocked; categories and verification locked by a human reviewer
Replay of outcome telemetry	Blocked	duplicate_replay_blocked for the same agent, project, and goal query
MCP initialize handshake	Success	Five tools listed; compare_projects call returned no error

4. Independent License Verification

Each license was checked against public sources. This verifies license terms only. Code was not cloned or reviewed.

Project	Confirmed license	Notes
Rufus	GPLv3	Stated in the official README. The GPL-3.0 claim in the bundle matches.
Ventoy	GPLv3	Stated in the official README. The bundle says GPL-3.0-or-later; the project says GPLv3. Minor mismatch.
vtoyboot (Ventoy Linux vDisk plugin)	GPL-3.0	Repository listing. Cited by the bundle as Ventoy's supporting evidence.
WinDiskWriter	GPL-3.0	Repository listing. README also bundles wimlib (LGPLv3) and grub4dos (GPLv2), not mentioned in the bundle.
macUSB	Not checked	Mac-only tool; outside the Windows-hosted scenario.

5. Discrepancies Found

a. WinDiskWriter is listed in the bundle as supporting Windows and Linux. Its README describes it as a macOS-only application. This is a factual error in the bundle's data and should be corrected before the ranking is relied on.

b. The bundle's Ventoy license reads GPL-3.0-or-later; the project states GPLv3. The difference is small but should match the source.

c. The bundle's freshness labels (for example, "Checked 6 hours ago") cannot be verified from public sources.

d. Ranking scores reflect capability fit and evidence, not security certification, per the bundle's own safety notice.

6. Benchmark (20 tasks)

Metric	Value
CapabilityMap tokens	6,036
Baseline GitHub tokens	84,000
Overall token savings	92.8%
Expected tool recall	90%
Spam false-positive rate	0%

These figures are as reported in the bundle. They were not independently reproduced.

7. Recommendations

1. Use Ventoy with vtoyboot as the primary approach for booting a Linux virtual disk from an external SSD.

2. Use Rufus on the Windows side to prepare installation or live media.

3. Exclude WinDiskWriter from this scenario and ask the bundle's maintainers to correct its OS support data.

4. Test suspend, hibernate, and GPU driver switching on the target hardware. No public source verifies these.
